Indoeside-diphosphate kinase (EC 2.7.4.6) DR-nm23 - human
N;Alternate names: DR-nm23 protein; non-metastatic cell-expressed protein 3
C;Species: Homo sapiens (man)
C;Date: 31-May-1996 #sequence_revision 31-May-1996 #text_change 09-Jul-2004
C;Accession: 139074
R;Venturelli, D.D.; Martinez, R.R.; Calabretta, B.B.
Proc. Natl. Acad. Sci. U.S.A. 92, 7435-7439, 1995

E; 119/Active site: His (phosphohistidine intermediate) #status predicted
E; 119/Active site: His (phosphohistidine intermediate)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 15
T08909
hypothetical protein T32A16.70 - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 11-Jun-1999 #sequence_revision 11-Jun-1999 #text_change 09-Jul
C;Accession: T08909
R;Bevan, M.; Zimmermann, W.; Grueneisen, A.; Wambutt, R.; Bancroft, I.
submitted to the Protein Sequence Database, May 1999
A;Reserence number: Z16518
A;Accession: T08909
A;Residues: 1-237 <BEV>
A;Cross-references: UNIPROT:Q8LAH8; UNIPARC:UPI00000ABF3A; EMBL:AL0784
A;Experimental source: cultivar Columbia; BAC clone T32A16
C;Genetics:
A;Gene: ATSP:T32A16.70
A;Map position: 4
A;Introns: 28/1; 74/1; 86/3; 103/3; 159/3; 197/2
C;Superfamily: nucleoside diphosphate kinase
                                                                                                                                                                                                                                                                                                                                                                                          ٠.

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically

binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

This invention describes a novel use of the NM23 protein family, analysis, diagnosis, prevention and/or treatment of skin or intediseases and/or wound healing and/or associated pathological

```
disturbances. The products of the invention have vulnerary, antitumour, gastrointestinal, dermatological, anti-inflammatory and antiulcer activity. The NM23 protein family act as nucleotide-diphosphate kinases, DNA-binding and transcription activating agents and regulators of Rascribes. The proteins of the invention, antibodies (Ab) directed against them, and their encoding nucleic acids, or related vectors, transformed cells and antisense sequences, are used for analysis, diagnosis, prevention and/or treatment of skin and intestinal diseases (where associated with uncontrolled tissue growth or cell differentiation, particularly skin and intestinal tumours, also psoriasis, Crohn's disease of and ulcers), wound healing and/or associated pathological alterations). They are also used to screen for agents that are potentially useful for treating these conditions. In vitro monitoring of NM23 protein expression in tissue samples provides an early diagnosis of disease. This sequence represents the human NM23B protein described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and

                                                               genetic
The sequences given in AAG79335-38 show the related human proteins M and H2S. These proteins are products of different genes, with NM23 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alterin its regulation may be an early stage in the metastatic cascade.

Allelic or homozygous deletion of the gene is detected in some priman
                                                                                                                                                                                                                                               AA;

e.g. detection angina, ischemia, myocardial infarction or arteriosclerosis by of a polynucleotide in a biological sample comprises detecting hybridization complex.

Claim 3; Page 251-252; 454pp; English

prognosing biological t The invention describes a method of predicting, diagnosing or pra cardiovascular disease by detection of a polynucleotide in a ksample comprises hybridising at least one of the polynucleotide nucleic acid material of a biological sample, thus forming a hybridisation complex, and detecting the hybridisation complex.

      reagent
polynucleotides, polypeptides, antisense molecule, antibody and reagent are useful for preparing compositions for preventing, predicting or diagnosing, or a medicament for treating a cardiovascular disease, e.g. arteriosclerosis, ischaemia, angina pectoris, or myocardial infarction. This sequence represents a protein identified in the invention a being differentially expressed in individuals with cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ind inhibits tyrosine kinase activity to the test compound and measuring in of the measured proteins or mRNA

metalloproteinase 1), vinculin, vascular endothelial growth factor (VEGF), placental growth factor (PLGF), VEGF/PLGF heterodimers or migration inhibitory factor (MIG), exposing the mammal to the test compound and then measuring in the mammal the level of at least one of the proteins and/or mRNA transcripts previously measured. The method of the invention may be useful for determining whether a test compound inhibits tyrosine kinase activity in a mammal. The current sequence is that of the tyrosine kinase activity inhibition-related protein of the

```

(TAT)

The invention relates to human tumour-associated antigenic targe polypeptides, and their related nucleic acids. The TAT polypepti

```
coverexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides, expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT nucleic and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, ovarian cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ଚ
                                         The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antiinflammatory, antiarthritic, antirheumatic, immunosuppressive, costeopathic, antidiabetic, dermatological, antipsoriatic, antiallergic, antiasthmatic, hepatotropic, and respiratory activity. A polypublication of the invention may have a use in gene therapy. The PRO polypeptide, its of agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, indiopathic inflammatory myopathy, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polyneuropathy, Guillain-Barre syndrome, a chronic inflammatory demyelinating polyneuropathy, a hepatobiliary disease, infectious or autoimmune chronic active hepatitis, primary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Whipple's disease, an autoimmune or immune-mediated skin disease, a bullous skin disease, erythem multiforme, contact dermatitis, psociasis, an allergic disease, erythem multiforme, contact dermatitis, psociasis, an allergic

This invention describes a novel method of predicting or determining whether a mammal will respond or is responding to an anti-cancer agent that modulates cyclin-dependent kinase (cdk) activity. The method comprises measuring the level of one or more biomarkers selected from 2774 biomarkers given in the specification (nucleotide sequence SEQ ID NO:1246 (Genbank EST W28729) is especially preferred). The method of the invention is utilized in a kit for determining or predicting whether patient would be susceptible or resistant to treatment by an agent modulating cdk activity. The invention also describes a method for utilizing individualized genetic profiles for treating diseases and disorders based on patient's response and molecular level, specialized microarrays comprising the biomarkers described, antibodies directed against the biomarkers and a cell culture model to identify biomarkers.

The cdk modulator is preferably N-5-[[5-(1,1-Dimethylethyl)-2-coxazolyl]methyl]thiol-2-thiazolyl-4-piperidine carboxamide, 0.5-L-cartaric acid salt. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences. This sequence represents a biomarker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for preparing a medicament the treatment of tumor metastases associated with overexpression of -PRUNE. The method comprise using inhibitors of human-PRUNE cyclic
                                                                                                                                                         The invention relates to an isolated nucleic acid encoding a PRO polypeptide. The polypeptide, agonist or an antagonist, antibody, composition, and method are useful for diagnosing and treating an related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis. The present sequence represents a PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OVGRNI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lung tumor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          useful
nucleotide phosphodiesterase. The invention may be useful for the development of compounds with a cytostatic activity acting as human-PRUNI overexpression inhibitors. The invention is useful for preparation of medicaments in the treatment of tumor metastases, for example breast carcinoma, sarcoma, neuroblastoma, prostate tumor, pancreatic tumor, colonic tumor, rectal tumor, medulloblastoma, epitelioma, epatocarcinoma, the h-PRUNE posses cyclic nucleotide phosphodiesterase activity with preferential activity for camp over cGMP, the h-PRUNE overexpression can be effectively suppressed by certain PDE inhibitors thus the PDE inhibitor provides an effective alternative therapy for cancer treatment. The present sequence is that of the h-PRUNE protein which was used during the development of the novel method of the invention.
                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                75

Claim 1; Fig

```
The invention relates to an isolated polynucleotide molecule encoding a human nm23 protein comprising nm23-H1 having a sequence of 746 base pairs (bp) fully defined in the specification or nm23-H2S having a sequence of 670 bp fully defined in the specification. The polynucleotide molecule of the invention is useful as a diagnostic tool for detecting and/or determining RNA or DNA which can be employed to detect mRNA expression in cancer cells to aid in predicting the malignant potential of a human tumour. The DNA and the antibodies may also be used to detect
The present sequence is the human nm23 protein nm23-H2S. Its coding sequence was isolated by searching a human lung cDNA library for sequences similar to pnm23-H2. Nm23 proteins are involved in tumour metastasis, and this protein, its gene and antibodies can be used to determine an individual's susceptibility to cancer and the likelihood of tumour metastasis within that individual. This is possible using a number of methods, including Northern blotting, nuclease protection assays, in situ hybridisation, immunohistochemical analysis and solid phase
                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                      144

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAG79335-38 show the related human proteins NM23-H1 and H2S. These proteins are products of different genes, with NM23-H1 being localised to chromosome 17. These proteins are used to predict aggressiveness (metastatic potential) of human tumours and in genetic tests for cancer susceptibility, diagnosis and prognosis, also for selection of treatment, e.g. susceptibility to early-onset familial breast cancer. Gene nm23 may contribute to tumourigenicity and alteration in its regulation may be an early stage in the metastatic cascade.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention also relates to the use of an autoantigen screening method to identify biomarkers that can be used in detecting liver diseases such as liver cirrhosis and liver cancer. The present sequence is the human nucleoside diphosphate kinase protein. This sequence is the autoantigen identified from cell lines using sera of patients with liver cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nseful

Sequence 2, Application US/09791118A

Patent No. US20020034741A1

GENERAL INFORMATION:

APPLICANT: Werner, Sabine

APPLICANT: Braun, Susanne

APPLICANT: Penzberg, Jorn-Peter

APPLICANT: Regenbogen, Johannes

TITLE OF INVENTION: Use of polypeptides or nucleic acids

TITLE OF INVENTION: encoding these of the gene family NM23 for the

TITLE OF INVENTION: treatment of skin or intestinal disorders, and

TITLE OF INVENTION: the identification of pharmacologically
                                                                                                                                                                                                                                                                                                                              ;
0

Sequence 2, Application US/09335948

Patent No. 6329198

GENERAL INFORMATION:

APPLICANT: National Institutes of Health
APPLICANT: Charles R. King
APPLICANT: Patricia S. Steeg

APPLICANT: Lance A. Liotta

TITLE OF INVENTION: PRODUCTION AND USE OF HUMAN NM23 PROTEIN

TITLE OF INVENTION: AND ANTIBODIES THEREFOR
FILE REFERENCE: 14014.0321

CURRENT APPLICATION NUMBER: US/09/335,948

CURRENT FILING DATE: 1999-06-18

PRIOR FILING DATE: 1995-06-07

PRIOR FILING DATE: 1991-12-11

PRIOR FILING DATE: 1991-12-11

PRIOR FILING DATE: 1999-10-18

NUMBER OF SEQ ID NOS: 6

SOFTWARE: FastSEQ for Windows Version 4.0
